13 questões · 0.9 por prova · Inglês · 10 por prova · 6,25% da nota

As questões aparecem **como imagem do caderno original da ESPM** — com mapas, charges, gráficos, frações e expoentes exatamente como na prova. Cada uma traz a prova e o número. Gabarito oficial no fim.

How James Brown Made Black Pride a Hit

It's been 50 years since he wrote "Say It Loud, I'm Black and I'm Proud," a song that is still necessary.

By Randall Kennedy

In the gym at Paul Junior High School in Washington, D.C., in the spring of 1968, not that long before the assassination of the Rev. Dr. Martin Luther King Jr., I asked a buddy whether he was interested in a certain girl. He told me that he was not because she was too dark.

*He and I were African-American. (Then we would have called ourselves Negro.) So was she. All of us supported the Civil Rights Movement and idolized Dr. King, yet I did not hold my friend's color-struck judgment against him. And he did not state his opinion with embarrassment. **We had both internalized our society's derogation of blackness.***

Indeed, we luxuriated in the denigration, spending hours trading silly, recycled but revealing insults: "Yo mama so black, she blend in with the chalkboard." "Yeah, well, yo mama so black, she sweats chocolate."

It was precisely because of widespread colorism that James Brown's anthem "Say It Loud, I'm Black and I'm Proud" posed a challenge, felt so exhilarating, and resonated so powerfully. It still does. Much has changed over the past half century. But, alas, the need to defend blackness against derision continues.

Various musicians in the 1960s tapped into yearnings for black assertiveness, autonomy and solidarity. Curtis Mayfield

and the Impressions sang "We're a Winner." Sly and the Family Stone offered "Stand." Sam Cooke (and Aretha Franklin and Otis Redding) performed "A Change is Gonna Come." But no entertainer equaled Brown's vocalization of African-Americans' newly triumphal sense of self-acceptance.

That Brown created the song most popularly associated with the Black is Beautiful movement is ironic. He generally stayed away from protest, endorsed the presidential re-election of Richard Nixon, lavishly praised Ronald Reagan, and consistently lauded Strom Thurmond.

His infrequent sallies into politics usually sounded in patriotic, lift-yourself-up-ism. In the song "America is My Home," he proclaimed without embarrassment that the United States "is still the best country / And that's without a doubt." Alluding to his own trajectory, he challenged dissenters to name any other country in which a person could start out as a poor shoeshine boy but end up as a wealthy celebrity shaking hands with the president.

At the very time that in "Say It Loud," Brown seemed to be affirming Negritude, he also sported a "conk" — a distinctive hairdo that involved chemically removing kinkiness on the way to creating a bouffant of straightened hair. Many African-American political activists, especially those with a black nationalist orientation, decried the conk as an illustration of racial self-hatred. For a brief period, Brown abandoned the conk and adopted an Afro, but that was only temporary. The conk was part of the characteristic look of "The Godfather of Soul."

Even though by 1968 uprisings against white supremacism had been erupting for a decade with great intensity and success — the Montgomery Bus Boycott, the Children's Crusade in Birmingham, the protest against disenfranchisement in Selma — prejudice against blackness remained prevalent, including among African-Americans.

Champions of African-American uplift in the 1960s sought to liberate blackness from the layers of contempt, fear, and hatred with which it had been smeared for centuries. Brown's anthem poignantly reflected the

psychic problem it sought to address. People secure in their status don't feel compelled to trumpet their pride. At the same time "Say it Loud!" was a rousing instance of a reclamation that took many forms. Instead of celebrating light skin, thin lips, and "good" (i.e., straight) hair, increasing numbers of African-Americans began valorizing dark skin, thick lips and "bad" (i.e., kinky) hair.

The reclamation of blackness in the sixties made tremendous headway quickly. By 1970 my friend would not have dared to repeat out loud what he had told me unapologetically two years before. Here, as elsewhere, however, changes wrought by the black liberation movement, though impressive, were only partial. Nearly four decades after the release of "Say It Loud," Professors Jennifer Hochschild and Vesla Weaver, having synthesized the pertinent academic literature, declared authoritatively that compared to their lighter-skinned counterparts, dark-skinned blacks continue to be burdened by lower levels of education, income, and job status. They receive longer prison sentences and are less likely to own homes or to marry. Filmmakers, advertisers, modeling agencies, dating websites and other key gatekeepers demonstrate repeatedly the ongoing pertinence of the old saw: If you're black get back. If you're brown, stick around. If you're white you're alright.

Intraracial colorism in Black America is often seen as a topic that should, if possible, be avoided, especially in "mixed company." That sense of embarrassment three decades ago prompted officials at Morehouse College to demand that Spike Lee cease filming on campus once they learned that his movie was exposing, among other things, black collegiate colorism. The impulse toward avoidance remains strong.

With racial prejudice against all African-Americans still a potent force, many would just as soon ditch the discussion of "black on black" complexional bias. Colorism, however, remains a baleful reality.

Half a century after James Brown's proclamation, it remains imperative to assert what should have been assumed and uncontroversial all along: that black is beautiful and as worthy of pride and care and consideration as any other hue.

Questão 49

The cartoon:

- a) was intended for child audiences.
- b) criticizes violence in fairy tales.
- c) condemns America's indifference to the death of foreign children.
- d) repudiates Adolf Hitler's decisions.
- e) depicts American mothers are mean and cold.

American author, political cartoonist, poet, animator, and illustrator, known for writing more than 60 children's books under the pseudonym "Norman F. Hays". As World War II began, he turned to editorial cartooning for the left-leaning *Chicago Tribune*, where he supported US entry into the war. This is one of his

children and spit out their bones . . .
and it really didn't matter."

INGL

Questão 41

The boy is upset because:

- a) he wants to see the bulldozer, but he can't.
- b) he doesn't like shady areas.
- c) he doesn't know who is going to buy the houses.
- d) the area has become a mud pit.
- e) he can't play with the animals.

Questão 42

The comic strip is mainly about:

- a) the need for more play areas in urban planning.
- b) the real estate trend not to preserve native forests in their projects.
- c) the fight to save endangered species from disappearing.
- d) costly residential projects that only very few can afford.
- e) environmentally friendly real estate development.

DESIGNING THE FUTURE

By Anne Underwood

Imagine buildings that generate more energy than they consume and factories whose waste water is clean enough to drink. William McDonough has accomplished these tasks and more. Architect, industrial designer and founder of McDonough Braungart Design Chemistry in Charlottesville, Va., he's

LÊS

not your traditional environmentalist. Others may expend their energy fighting for stricter environmental regulations and repeating the mantra "reduce, reuse, recycle." McDonough's vision for the future includes factories so safe they need no regulation, and novel, safe materials that can be totally reprocessed into new goods, so there's no reason to scale back consumption (or lose jobs). In short, he wants to overhaul the Industrial Revolution--which would sound crazy if he weren't working with Fortune 500 companies and the government of China to make it happen. He spoke in New York with *NEWSWEEK*'s Anne Underwood.

UNDERWOOD: *Why do we need a new industrial revolution?*

MCDONOUGH: *The Industrial Revolution as a whole was not designed. It took shape gradually as industrialists and engineers figured out how to make things. The result is that we put billions of pounds of toxic materials in the air, water and soil every year and generate gigantic amounts of waste. If our goal is to destroy the world--to produce global warming and toxicity and endocrine disruption--we're doing great. But if the goal isn't global warming, what is? I want to crank the wheel of industry in a different direction to produce a world of abundance and good design.*

Yesterday misunderstands what made the Beatles so popular

By Noah Berlatsky

*The film **Yesterday** has an intriguing premise: What if the Beatles never existed? Unsuccessful, moderately talented singer-songwriter Jack Malik wakes up one day and is the only one who remembers the Beatles' songs. Suddenly he can pose as the creator of the greatest music ever written. As a result, he quickly becomes a world-renowned superstar.*

Jack is successful because the Beatles' songs, removed from their original context, still maintain the universal, instant appeal that has canonized them in our non-fictional world, offscreen. Label execs, other musicians, and huge numbers of fans are all won over by "Jack's" music; Even decades after the Soviet Union disintegrated, "Back in the USSR" still rocks people's world.

*But would "Back in the USSR" really be an automatic, surefire hit if it were released today, into a music scene whose interests have evolved far beyond the Beatles? Is quality in the arts so transcendent that it can overcome all differences of era, culture, and **happenstance**? Is music a meritocracy — an art form that privileges natural talent over everything else?*

There's good reason to believe that the answer to all three of those questions is no. Wonderful songs aren't always hits; talented musicians don't always achieve success commensurate with their abilities.

And sometimes a twist of fate lands the less talented in a position to reap massive rewards.

We tend to expect that good things don't always come to the most deserving people. Sometimes the most successful people get that way because they're in the right place at the right time, or know the right people, or were even born into it. And art is no exception.

There's research to back up the notion that fame and fortune come from more than pure talent. Sociologists Matthew Salganik of Princeton and Duncan Watts of Microsoft have conducted a number of studies to determine what makes a song popular. They discovered that when someone approaches a song knowing only that it's popular and well-liked within the cultural mass, that person is more inclined to come away liking the song too. This can create a ripple effect, with songs becoming more and more popular because they already are popular. Salganik and Watts's research suggests that the more visible something is the more highly regarded it is, and the more popular it is likely to become.

Social influence has a powerful effect on which songs become popular. As art is a form of communication we often share and experience socially, it makes sense that we like art that we believe will connect us to others.

Our instincts to spread what we like, and to like what others like, mean that what seem like small advantages for a song — perhaps a well-placed promo on Spotify, or appearing on the soundtrack of a Netflix show — can lead to a big chart presence. A good review at the right time or being used in a viral meme on a slow news day could help more people discover a song just out of happenstance. Songs that get an initial bump can ride that wave, so more people seek them out, buy them, and boost their popularity. This cycle can lead to one song, good or not, becoming a hit, while another disappears into obscurity.

The Beatles were very good by most qualitative metrics. But the band's quantitative achievements don't mean they are indisputably the most meritorious musicians of all time, or even of their day. More likely, the band **also** managed to be in the right place at the right time, on top of everything else.

Western racial inequalities also stymied many homegrown artists. Influential African American singers and girl groups like the Shirelles didn't have much opportunity to turn their Billboard hits into widespread celebrity and lasting cultural recognition. Paul McCartney and John Lennon are household names, but there aren't many casual music fans who know the name of the Shirelles' lead singer, Shirley Owens.

The Beatles were white, male English speakers who were able to tour and didn't die young. But they had other advantages as well. Perhaps most obviously, they were working in a genre that was broadly popular.

By contrast, today's most popular music is split between contemporary hip-hop and dance music that relies on synthesizers, electronics, and myriad cross-genre references. Pure rock 'n' roll, built on a simple four-person setup of guitar, bass, drums, and vocals, is no longer the dominant genre. "If a Beatles song came out today, it would sound dated," Charlie Harding, host of Vox's **Switched on Pop** podcast, told me. "There are hardly any synthesizers. It's all live drumming. Plus, so much of their music is blues-based, and blues-based music just isn't popular right now."

At their height, the Beatles famously pushed boundaries in the studio, creating psychedelic effects and soundscapes that no one at the time had ever heard before. But that's old hat in 2019. You can do all of what the Beatles did and more in your room with a laptop, at least technically speaking.

Sure, it's fun to think, as **Yesterday** does, that our love for the Beatles is universal, true, and incontrovertible. Where's the harm in that?

ESPM

The problem is that people often don't see the myth of meritocracy as a myth; they really believe in it. And when they do, it can have some unfortunate effects. The myth of meritocracy can make us less willing to invest in the collective good.

If we convince ourselves that talented artists like the Beatles will be successful no matter what, we can also convince ourselves that we don't really need to provide people with safety nets or resources. After all, the best will win out anyway. Why invest in school arts programs, or fund arts grants, if great musicians will be just fine on their own?

*The Beatles made wonderful, undoubtedly influential art. But if **Yesterday** weren't so hypnotized by the supposedly unmatched quality of the Beatles' music, it might be able to see that there are great songs being written by people like Jack Malik too. The film believes that songs like "Yesterday" are just so good, they would become mega-popular under any circumstances. And yet many people who think "Yesterday" is the best song ever have been inevitably swayed by the Beatles' popularity and legacy, the song's quality aside.*

Maybe instead, the best song ever is one we haven't heard yet; maybe it's the one you're going to write. Part of what happens when we abandon the myth of meritocracy is that we're better able to see the merit all around us. And that gives everyone a greater chance at success.

A Chinese app conquered the planet - and now the U.S. is threatening to shut it down. Can the world's biggest virality machine survive?

By Alex W. Palmer, Dec. 20, 2022

On March 10, two weeks after Russia's invasion of Ukraine, the White House convened a Zoom call with 30 prominent TikTok creators. Jen Psaki, then the White House press secretary, and members of the National Security Council staff briefed the creators, who together had tens of millions of followers, on the latest news from the conflict and the White House's goals and priorities. The meeting followed a similar effort the previous summer, in which the White House recruited dozens of TikTokers to help encourage young people to get vaccinated against Covid.

The app had only become more popular in the intervening months. "We recognize this is a critically important avenue in the way the American public is finding out about the latest," the White House director of digital strategy, Rob Flaherty, told the assembled group. "So we wanted to make sure you had the latest information from an authoritative source." Yet at the same time, the Biden administration was more than a year into negotiations with ByteDance, the Chinese company that created and owns TikTok, about national security concerns surrounding the app. In fact, the White House staff members who organized and briefed the TikTok creators were barred from downloading the app on their work phones.

The administration's contradictory approach to TikTok — its embrace of the app as a vital conduit to the public, and its fear of the app as a potential tool of foreign influence — is perhaps a fitting

response to the utterly unique problem that TikTok poses. Seemingly overnight, TikTok has managed to remake American culture both low and high, from media and music to memes and celebrity, in its own image. TikTok turned Olivia Rodrigo into a household name and propelled the author Colleen Hoover to the top of the best-seller list, with more copies sold this year than the Bible. TikTok coined "quiet quitting," one of the hallmark phrases of 2022, and introduced a whole new dialect of algospeak — "seggs," "unalive," "le dollar bean" — that is now spreading across pop culture. Corporations and brands, from Goldfish crackers to Prada, have redirected billions of dollars worth of advertising to the platform in recognition of its all-encompassing reach, which can, at seemingly any moment, turn even a decades-old product into a must-have item. Last year, TikTok had more site visits than Google, and more watch minutes in the United States than YouTube. Facebook took almost nine years to reach one billion users; TikTok did it in five.

The app's extraordinary success is made even more remarkable by the fact that it is a product of America's greatest political rival. Despite decades of trying, no Chinese company has ever conquered American society like TikTok. It's difficult to imagine a Russian or Iranian company — or, increasingly, even another Chinese company — pulling off a similar feat. TikTok's provenance has stoked persistent and long standing worries about its vulnerability to exploitation and manipulation by the Chinese government. Over the last year in particular, TikTok has faced an unceasing stream of bad press, with each week seeming to bring a fresh revelation about the company's questionable data practices and spotty internal safeguards. In just the last six months, TikTok and ByteDance have been accused of lying about the access of China-based employees to American user

data, using a news app to push pro-Beijing content abroad and allowing Chinese state media accounts to run unchecked and unlabeled as they criticized the American political process.

If TikTok's popularity has thus far provided it some insulation against government action, the app's time may be running out. In November, Brendan Carr, a commissioner of the F.C.C., said it should be banned outright. Senator Mark Warner, co-chairman of the Senate Select Committee on Intelligence, said of a ban, **"The sooner we bite the bullet, the better."** Christopher Wray, director of the F.B.I., told Congress he was "extremely concerned" about TikTok's operations in the United States. Earlier this month, Senator Marco Rubio introduced legislation that would effectively prevent TikTok from operating in the United States by banning all apps "subject to substantial influence" by China, Russia and other foreign adversaries.

The Biden administration, meanwhile, is said to be nearing a deal with TikTok. Speaking at a conference of tech leaders, Kemba Walden, the principal deputy national cyber director, said that the White House had not made any final decision on a ban, but voiced support for "any measure that will raise security." Maryland, South Dakota, South Carolina, Nebraska, Texas, Alabama and Utah have already banned use of the app on state devices. A bill passed by the U.S. Senate last week would do the same at the federal level. The military has also barred the app from government devices.

In the United States, being tough on China is one of the few areas of bipartisan agreement. And in this fraught geopolitical context, TikTok is considered a Trojan horse — for Chinese influence, for spying, or possibly both. In China, meanwhile, government regulation has sought to control ambitious tech companies and their founders, out of fear that, with their influence,

independence and popularity, they were becoming alternative power bases to the Chinese Communist Party. TikTok itself is not available in China — users there must access **Douyin**, a different ByteDance app, which follows Chinese government directives on censorship and propaganda.

Just a few years ago, the rise of ByteDance seemed like an announcement of an era of Chinese app dominance. Indeed, it would be hard to find a company more self-consciously modeled, in both spirit and substance, on America's tech giants. ByteDance's founder internalized the mythos of Silicon Valley, taking to heart the idea, long promoted by Washington, that the American market was the ultimate prize, and that it welcomed any entrepreneur with the talent and ambition to succeed. But now, with walls going up on both sides of the Pacific, TikTok seems likely to be the last of its kind as well as the first. The company is caught in the middle between the old era and the new — too Chinese for America, too American for China.

- c) Michaela is similar to any private schools, all of which don't charge any fees;
- d) Despite having the spirit of private schools, Michaela charges nothing in exchange for its services;
- e) Private schools' ethos allows no fees to be charged.

Can Nature Lie?

The lying that we humans **do** requires a more sophisticated kind of cognition than a bird, flower, or fungus can muster.

By Robin Marantz Henig

*Analyzing animals to better understand Homo sapiens has become a sub-genre in the field of science writing. Sometimes this works well, as when Sabrina Imbler uses a purple octopus, starving to death while incubating her eggs, as a metaphor for disordered eating in *How Far the Light Reaches*. But other times, the enterprise feels downright Procrustean: An author amasses a wide swath of animal activities, even down to the level of the cell, and describes them in ways that might give the impression that some human quality has an analogue out there in the biosphere.*

*The compression is most strained when the activity being explained is complex and quintessentially human, such as deception. This makes the enterprise of writing *The Liars of Nature* and the *Nature of Liars*, a recent book by Lixing Sun, especially difficult. Sun, a professor of animal behavior, ecology, and evolution at Central Washington University, presents a string of entertaining facts about the many ways plants and animals use trickery to survive. But the language is too casually anthropomorphic, undermining the points he's trying to make about cheating in the natural world. At the outset, Sun acknowledges that ascribing intentionality to animal behavior is "neither easy nor*

necessary," and admits that deceptive adaptations arise from the unplanned march of evolution. "Cheating flourishes in nature as a direct result of natural selection," he writes. It also "serves as a potent selective force that drives evolution on its own." But his word choices and awkward phrasing often leave the reader with only a partial understanding of how flora and fauna actually "lie" and "deceive."

The behavior we think of as lying requires a more sophisticated kind of cognition than telling the truth does—and certainly a more sophisticated kind of cognition than a bird, flower, or fungus can muster. Years ago, when I was reporting an article about the science of deception, the psychologist Paul Ekman told me that a liar needs three qualities to succeed: the ability to think strategically, like a good chess player; the ability to read the needs of others, like a talented therapist; and the ability to manage emotions, like a grown-up. In other words, a good liar needs a high level of both cognitive and emotional intelligence.

And though lying—at least in humans—might be an ingenious skill, the evolution through which cheating arises in the natural world is not smart in the least. The way Sun describes each example makes it seem that plants and animals develop particular traits of fakery or mimicry out of some sort of mischievous, cunning impulse. But there's nothing deliberate about evolutionary adaptation, which is the perpetuation of traits, arising randomly, that improve an organism's chance of staying alive, reproducing, and passing along the same advantageous traits to the next generation. It's a stupid process, lacking not only intentionality but also any kind of end goal beyond helping a particular organism survive and reproduce.

Sun knows this; he's a biology professor, after all. But the diction he deploys suggest otherwise. Sun, like others, falls into the science-writing trap of stretching biological phenomena to

fit the contours of human understanding. As a result, the reader can be forgiven for coming away with the impression that cheating fauna and flora—right down to the level of bacteria—are clever enough to always have, as he puts it in one of his many awkward attempts to be engaging, a few new “tricks up their sleeves.”

His colorful word choices—no doubt employed to make his writing more accessible and fun—seem to elide randomness altogether. He uses terms such as imposters, hustlers, and con artists to describe the book’s animals, including Pacific tree frogs, and talks of the “tricks” that were “invented” by the duplicitous cuckoo. He uses words like these to characterize cheats that don’t even have nervous systems, such as the South American passion flower. It has evolved spots on its leaves that resemble the eggs of the Heliconius butterfly, which cause the butterfly to avoid laying its clutch there and instead move on to a plant that looks unoccupied—a handy deflection, what Sun calls a “most peculiar form of plant mimicry,” because newly hatched Heliconius caterpillars can be quite destructive to the passion flower. As Sun chooses to describe it, those yellow spots arose because “these plants can ‘read the mind’ of Heliconius butterflies.” But in truth, no plant ESP is involved; those fake-out butterfly eggs are the result of a random mutation in leaf coloration that turned out to have a benefit for the mutant plant. And using scare quotes around “read the mind” doesn’t get the author off the hook.

If you’re looking for a compilation of weird facts about the splendors of the natural world—something that’s been called the “gee-whiz” approach to science writing—this book delivers. It is an often-enlightening collection of some stunning acts of animal trickery that have evolved in the brutal Darwinian struggle for survival. Dropping some of the tidbits you picked up here would make you the hit of the cocktail party. Did you know, for instance, that the stripes of a zebra create a confusing effect called “razzle dazzle,” and that their advantage may be in keeping away tsetse flies?

*In the last chapters of the book, Sun tries to draw a straight line from these many organisms to humans. We can, he writes, "use our newly acquired evolutionary understanding of how cheaters operate to design novel strategies to combat cheating in our society." Sun's desire to draw lessons from the natural world about human lies has a subtler danger: Other living things are not just furry or feathery little proto-people, and comparing their behavior to ours risks underappreciating them as the amazing organisms they are. The astounding variety of the biosphere, evolved through random mutations over the course of eons, is reason enough to marvel at all the ways that certain surprising conduct has helped plants and animals thrive. So my recommendation is to read *The Liars of Nature* and the *Nature of Liars* for its great cocktail-party fodder, and to leave lessons about human deception to the psychologists, neuroscientists, and philosophers.*

Robin Marantz Henig is a freelance science writer whose books include *The Monk in the Garden*, *Pandora's Baby*, and *Twentysomething*.

Questão 49

The following comics are jokes because of ambiguities. These ambiguities happen:

- a) in the way both use the verb lie/lies;
- b) due to their verb choices;
- c) in their negatives;
- d) in their characters' representations;
- e) in their use of the prepositions (out and ahead).

Emerging tech, like AI, is poised to make healthcare more accurate, accessible and sustainable

(Adapted from World Economic Forum,
<https://www.weforum.org/>)

Emerging technologies such as artificial intelligence (AI) and machine learning are transforming nearly all industries, among them the healthcare industry, which accounts for 11% of global GDP or \$9 trillion annually. From the development of drugs and vaccines, to improving medical diagnosis and treatment, such technologies are being used in all stages of the value chain, boosting efficiencies across the overall healthcare system. As the World Economic Forum launches the 2023 cohort of Technology Pioneers, we asked the several selectees how such emerging technologies are changing global health outcomes. Here is what two of them said:

'We can sculpt a future where quality healthcare is not a privilege for the few'

Andrés Lawson, Chief Executive Officer, Osana

In the face of complex and pressing global health problems, emerging technologies like AI and machine learning are transformative forces poised to make healthcare more accurate, accessible and economically sustainable.

AI and automation provide operating leverage for healthcare institutions, enhancing efficiency and improving outcomes. They can potentially transform healthcare delivery, increasing the supply and scalability of healthcare professionals. For instance, AI algorithms can analyze medical imaging data to identify early signs of diseases like cancer, often with greater accuracy than human doctors and

at a lower cost. This allows for earlier, more effective treatment, potentially saving millions of lives.

However, it is essential to exercise forethought to guard against **unintended consequences**, which means adopting a safety-first, human-first approach in the development and deployment of these models. Technical challenges like privacy, bias and reliability must be intentionally addressed. Collaboration with key ecosystem stakeholders to certify models and develop governance frameworks for Responsible Healthcare General Intelligence is vital.

As we stand on the brink of this exciting new frontier, the vision of a healthier world, buoyed by AI and machine learning, is within our grasp. These technologies hold the promise of a transformative leap in our global health landscape, enabling us to counter medical challenges with unprecedented agility and accuracy. By harnessing AI and machine learning judiciously and responsibly, we can sculpt a future where quality healthcare is not a privilege for the few but a fundamental right for all.

'AI and machine learning will take healthcare to the next level'

Alicia Chong, Chief Executive Officer,
Bloomer Health Tech

The convergence of continuous physiological data on lifestyle and environment is quickly leading to deep phenotyping. By combining this with the power of genomics, machine learning and AI will take healthcare to the next level.

At Bloomer Tech we've focused on understanding the cardiovascular system in women specifically, because even with over 30 years of evidence on sex differences, women continue to be harder to diagnose and treat, and consistently

experience worse outcomes. Using AI to generate new digital biomarkers will transform this field and impact global health results, particularly for diseases and conditions that affect women disproportionately, differently and even uniquely.

Inspired by the technological transformation that resulted when we transitioned from the limitations of only being able to view photos through chemical processes and film, to enabling accessible, unlimited photos through compact, easy-to-use digital cameras, we are moving in the right direction.

We are pushing to move from existing, valuable though limited biomarkers that can only be viewed via chemical processes in labs, towards using AI trained with reliable data, continuously collected from everyday garments like women's bras.

The impact of ubiquitous access to data will be huge. Being able to read and examine the data when it's needed most instead of just starting a series of tests when it may already be too late will significantly impact people's health across the world, allowing for proactive and preemptive care.

Questão 50

Read the comic strip and answer the question below it:

Disponível em: <https://twitter.com/WTFrameComics/status/1132703261402763264>

In the comic strip above, the character explains to his past self that:

- a) there aren't flying automobiles in the future;
- b) he really misses his old house appliances;
- c) modern advances created new lifestyles;
- d) there is a downside to the modern advances;
- e) the device chargers do not work properly.

GEN Z NEVER LEARNED TO READ CURSIVE

How will they interpret the past?

By Drew Gilpin Faust

(1) *It was a good book, the student told the 14 others in the undergraduate seminar I was teaching, and it included a number of excellent illustrations, such as photographs of relevant Civil War manuscripts. But, he continued, those weren't very helpful to him, because of course he couldn't read cursive.*

(2) **Had I heard** him correctly? Who else can't read cursive? I asked the class. The answer: about two-thirds. And who can't write it? Even more. What did they do about signatures? **They had invented** them by combining vestiges of whatever cursive instruction they may have had with creative squiggles and flourishes.

(3) In 2010, cursive was omitted from the new national Common Core standards for K-12 education. The students in my class, and their peers, were then somewhere in elementary school. **Handwriting instruction had already been declining** as laptops and tablets and lessons in "keyboarding" assumed an ever more prominent place in the classroom. Most of my students remembered getting no more than a year or so of somewhat desultory cursive training, which was often pushed aside by a growing emphasis on "teaching to the test." Now in college, they represent the vanguard of a cursiveless world.

(4) Although I was unaware of it at the time, the 2010 **Common Core policy on cursive had generated** an uproar. Defenders of script argued variously that knowledge of cursive was "a basic right," a key connection between hand and brain, an essential form of self-discipline, and a fundamental expression of identity. Its disappearance would represent a craven submission to "the tyranny of 'relevance.'"

(5) Within a decade, cursive's **embattled** advocates had succeeded in passing measures requiring some

sort of cursive instruction in more than 20 states. At the same time, the struggle for cursive became part of a growing, politicized nostalgia for a lost past. In 2016, Louisiana's state senators reminded their constituents that **the Declaration of Independence had been written** in cursive and cried out "America!" as they unanimously voted to restore handwriting instruction across the state.

(6) Yet the decline in cursive seems inevitable. Writing is, after all, a technology, and most technologies are sooner or later surpassed and replaced.

(7) By the turn of the 20th century, the typewriter had become sufficiently established to prompt the first widespread declarations of the obsolescence of handwriting. But it would be a long demise. In 1956, *Look* magazine pronounced handwriting "out-of-date," yet cursive still claimed a secure place in the curriculum for decades.

(8) Given a current generation of students in which so few can read or write cursive, one cannot assume it will ever again serve as an effective form of communication. I asked my students about the implications of what they had told me, focusing first on their experience as students. No, most of these history students admitted, they could not read manuscripts.

(9) I continued questioning: Didn't professors make handwritten comments on their papers and exams? Many of the students found these illegible. Sometimes they would ask a teacher to decipher the comments; more often they just ignored them. Most faculty, especially after the remote instruction of the pandemic, now grade online. But I wondered how many of my colleagues have been dutifully offering handwritten observations without any clue that they would never be read.

(10) What about handwriting in your personal lives? I went on. One student reported that he had to ask his parents to "translate" handwritten letters from his grandparents. I asked the students if they made grocery lists, kept journals, or wrote

thank-you or condolence letters. Almost all said yes. Almost all said they did so on laptops and phones or sometimes on paper in block letters.

(11) During my years as Harvard president, I regarded the handwritten note as a kind of superpower. I wrote hundreds of them and kept a pile of note cards in the upper-left-hand drawer of my desk. They provided a way to reach out and say: I am noticing you. This message of thanks or congratulations or sympathy comes not from some staff person or some machine but directly from me. I touched it and hope it touches you. Now I wonder how many recipients of these messages could not read them.

(12) All of us, not just students and scholars, will be affected by cursive's loss. The inability to read handwriting deprives society of direct access to its own past. We will become reliant on a small group of trained translators and experts to report what history—including the documents and papers of our own families—was about. The spread of literacy in the early modern West was driven by people's desire to read God's word for themselves, to be empowered by an experience of unmediated connection. The abandonment of cursive represents a curious reverse parallel: We are losing a connection, and thereby disempowering ourselves.

(13) On the last day of class, a student came up to me with a copy of one of my books and asked me to sign it. I wrote an inscription that included not just his name and mine, but thanks for his many contributions to the seminar. Then I asked, a little wistfully, if he'd like me to read it to him.

Questão 45

(<https://theweek.com/cartoons/548810/editorial-cartoon-education>)

The cartoon above illustrates an idea presented in:

- a) Paragraph 2;
- b) Paragraph 4;
- c) Paragraph 6;
- d) Paragraph 8;
- e) Paragraph 10.

Questão 50

(<https://twitter.com/GSammonWrites/status/1553713452853641217>)

The cartoon above shows:

- a) The children using technology and ignoring their mom's talk;
- b) A clash of generations with regard to divergent writing styles;
- c) The children using abbreviations in cursive writing;
- d) The blond girl clarifying to the boy what their mother is saying;
- e) The mother's attempt to teach her children a style called cursive.

'It is OK to be content with your simple life': is 'underconsumption core' the answer to too much shopping?

Influencers are pushing back against consumerism by encouraging followers to repair or repurpose their stuff. But is this 'trend' just what many people call normal life?

Sara Radin
7 Aug 2024

- (1) *"This is your daily reminder that most of the content you see online is not the way most people live," says sustainability influencer Sabrina Pare, in a video she posted to her 250,000 TikTok followers recently. "It is OK to be content with your simple life," she continues as she makes her bed. "It is not normal to do massive clothing hauls, daily trips to Target and have a new outfit every day. **Nor** do I think it should be aspirational."*
- (2) *It is one of a slew of videos that are surfacing online of people making a point of using and appreciating what they already have, or what they find on online hand-me-down groups, rather than showing new clothes acquired on the daily from Amazon or the next Stanley cup accessory, or the latest Dyson hairdryer. It's all part of a trend aiming to encourage people to reconsider how much they consume – say hello to underconsumption core.*
- (3) *Also called normal core or normal consumption, the movement is about taking on an attitude of mindfulness and "less is more" at a time when overconsumption is rife and TikTok is full of content encouraging users to buy things they don't need. Pare, who goes by @sabrina.sustainable.life on TikTok, says underconsumption core videos show items that "might not be the newest, but still work". Underconsumption core influencers, she says, are "showing items they have upcycled, ways they reduce waste, and*

things they have gotten second hand. It's all about extending the life of your items, reducing the number of items you own, and being mindful of your purchases." Pare has been posting frequently about underconsumption core since the middle of July, which is when she says she began seeing it popping off on TikTok. It follows the deinfluencing movement, which started last year and encouraged consumers not to buy anything. Now, creators are proudly showing the use and reuse of everyday items and clothes they've had for years. In another of her recent videos, Pare shows how to extend the lifespan of your knives. It's not the most glamorous or compelling content on social media, but Pare's videos have amassed nearly 15m likes.

- (4) Amid new "cores" popping up every day, which encourage mass consumption, underconsumption core is **tongue in cheek**. "The irony lies in the fact that underconsumption is a practice, while 'core' refers to an aesthetic," says trend creator and **Depop** trend specialist Agus Panzoni. How can you under consume when there is no codified amount you are meant to consume? And what does it matter what consuming less looks like – the point of the movement is surely in the doing, rather than what that looks like aesthetically?
- (5) According to Shanu Walpita, a trend forecaster who teaches in the communications department at London College of Fashion, "underconsumption core is a memetic antithesis to a consumerist hype cycle we have become accustomed to". It's a viral rebranding of conscious consumerism where people are flexing "luxe" slowness. Beyond this, it reflects a growing shift in consumer behaviour. "People want to lower the quantity of clothing they've purchased and focus on sustainable, and mindful purchasing habits," says Panzoni.

- (6) Underconsumption core is driven by several factors, including, "environmental awareness," she says. "The spotlight that has been put on fast fashion and its damaging impacts, as well as the global increase in desire to buy second hand. According to Walpita, **defluencing**, **defashioning** and other de/core buzzwords have been hinting at this shift in consumer mindset for a while now. "Consumers are celebrating minimalism as a form of activism," she says.
- (7) But good intentions and "doing better" to one side, "there's no denying acute financial and economical constraints play a part in the advancement of this trend," says Walpita. As people have less money, many have had to foster more of a make-do-and-mend mindset.
- Critics have been quick to highlight that the tenets of underconsumption core are nothing new. _____ Pare says it feels good to see others posting the kind of content she has always shared – "I love this trend. I love to see how widespread it has become and how many people are participating." – she also points out that "lower-income individuals have been doing many of the things that are shown in these videos for ages". But rather than glamorising a certain way of living, she believes underconsumption core is normalising the way many people already live. "I think of my immigrant grandparents who don't waste a crumb of food. They would be very happy to see this trend," she says.
- (8) Walpita points to the ethical implications of underconsumption core. "It would be iffy to not acknowledge the fetishisation or glamorisation of poverty and class hierarchy," she says. "The irony is that there is an element of privilege to choosing to actively lean into underconsumption and turn it into a form of viral, sharable content." She says there's also little acknowledgment of the fact that this viewpoint negates the communities, such as those in the global south, where these practices are common (and not necessarily linked to poverty or class) – rather, they are cultural necessities and signifiers of care.

- (9) *"A lot of people are responding [to the trend] by saying this is what it is like being working class," says Georgina Johnson, editor of The Slow Grind: Practising Hope and Imagination, an intersectional environmentalist anthology. According to Johnson, underconsumption core is missing cultural and racial nuance. In her experience, she has seen many trends besides underconsumption core take off that she considers to be inherently Black – "we haven't had so much so we've learned to reuse things." Still, she thinks it can be a positive thing. "It's just about how it's contextualised and who is given visibility around it."*
- (10) *While Panzoni believes there are some positive implications, highlighting the way the trend promotes owning fewer possessions, she also understands why people might take issue with the way it "glamorises the experience of those who don't have the means to not engage in underconsumption core." But, she says, in the era of Temu and Shein, where new clothing and household items can be found at incredibly low prices, there's a net positive in a trend that encourages us to appreciate the look of quality, well-used products.*
- (11) *It speaks to a wider cultural shift, with people looking for ways out of mass consumerism. "People are starting to realise that consumerism can make us feel lonely because it pushes us to seek fulfillment and happiness in material possessions, rather than meaningful relationships," says Pare. "Many people buy things for fulfillment, but those feelings don't tend to last long, so then they buy something again, and it's a vicious endless cycle of consumption." True happiness, she says, comes from diving into hobbies and passions, spending time with loved ones and being involved in your community – not from Stanley cups and viral hairdryers.*

Questão 50

<https://www.gocomics.com/speedbump/2010/09/13>

After reading the monk's words, we may assume that he:

- a) has always lived by precepts that resemble underconsumption core.
- b) has had no choice but to live in extreme poverty.
- c) has no regrets to have adopted a life of material possessions.
- d) might be trying to convince the other monk to undergo a cultural shift.
- e) disdains the lifestyle he used to have before taking his monastic vows.

Caffeine's Dirty Little Secret

"How much is too much?" is an impossible question.

By Yasmin Tayag

Illustration by Ben Kothe / The Atlantic. Source: Getty.

JANUARY 26, 2024

(1) On Tuesday, curiosity finally got the best of me. How potent could Panera's Charged Lemonades really be? Within minutes of my first sip of the hyper-caffeinated drink in its strawberry-lemon-mint flavor, I understood why memes have likened it to an illicit drug. My vision sharpened; sweat slicked my palms.

(2) Laced with more caffeine than a typical energy drink, Panera's Charged Lemonade has been implicated in two wrongful-death lawsuits since it was introduced in 2022. Though both customers who died had health issues that made them sensitive to caffeine, a third lawsuit this month alleges that **the lemonade gave an otherwise healthy 27-year-old lasting heart problems**. Following the second death, Panera denied that the drink was the cause, but in light of the lawsuits, it has added warnings about the drink, reduced its caffeine content, and removed the option for customers to serve themselves.

(3) *All the attention on Panera's Charged Lemonade has resurfaced an age-old question: How much caffeine is too much? You won't find a simple answer anywhere. Caffeine consumption is widely considered to be beneficial because it mostly is—boosting alertness, productivity, and even mood. But there is a point when guzzling caffeine tips over into uncomfortable, possibly unhealthy territory. The problem is that defining this point in discrete terms is virtually impossible. In the era of extreme caffeine, this is a dangerous way to live.*

(4) *Most people don't have to worry about dying after drinking a Charged Lemonade. The effects, though uncomfortable, usually seem to be minor. After drinking half of mine, I was so wired that I couldn't make sense of the thoughts ricocheting around my brain for the next few hours. Caffeine routinely leads to jitteriness, nervousness, sweating, insomnia, and rapid heartbeat. If mild, such symptoms can be well worth the benefits.*

(5) *But consuming too much caffeine can have serious health impacts. High doses—more than 1,000 milligrams a day—can result in a state of intoxication known as caffeinism. The symptoms can be severe: People can “develop seizures and life-threatening irregularities of the heartbeat,” and some die, David Juurlink, a toxicology professor at the University of Toronto who also works at the Ontario Poison Centre, told me.*

(6) *You're unlikely to ingest that much caffeine from beverages alone, yet the increasing availability of highly caffeinated products makes it more of a possibility than ever before. Besides Panera's Charged Lemonade, dozens of energy drinks contain similar amounts of caffeine, and some come in candy-inspired flavors such as Bubblicious and Sour Patch Kids. Less potent but highly snackable products include caffeinated coffee cubes, energy chews, marshmallows, mints, ice*

pops, and even vapes. Consumed quickly and in rapid succession, these foods can lead to potentially toxic caffeine intake "because your body hasn't had time to tell you to stop," Jennifer Temple, a professor at the University of Buffalo who studies caffeine use, told me.

(7) More than ever, we need a way to track our caffeine consumption, but we don't seem to have any good options. In all of the lawsuits against Panera, the basic argument is this: **Had the company more adequately warned customers of the drink's caffeine content, perhaps no one would have been hurt.** But most of us just aren't used to thinking about caffeine in numerical terms the way we do with calories and alcohol by volume (ABV). Caffeine intake is generally something that's not measured but experienced: I know, for example, that a double espresso from the office coffee machine will give me the shakes.

_____ I knew how much caffeine is in a Charged Lemonade, I had no idea how much of it I could drink before having the same reaction.

(8) Although people generally aren't aware of the amounts of caffeine they consume, they tend to develop a good sense of how much they can handle, Temple said. But usually, this knowledge is product-specific; when trying a new caffeine product, the effect can be hard to predict. Part of the problem is that the amount of caffeine in products varies dramatically, even among drinks that may seem similar: A 12-ounce Americano from McDonald's contains 71 milligrams of caffeine, but the same drink at Starbucks contains 150 milligrams. The caffeine in popular energy drinks ranges from 75 milligrams (Ocean Spray Cran-Energy) to 316 milligrams (Redline Xtreme), according to the Center for Science in the Public Interest.

(9) The reason we aren't good at thinking about caffeine is that historically, we've never really had to think that hard about it. Sure, one too many espressos might have occasionally put someone over

the edge, but caffeine was consumed and sold in amounts that didn't require as much thought or caution. "A generation ago, you didn't have all these energy drinks," so people didn't grow up learning about safe caffeine consumption the way they may have done for alcohol, Darin Detwiler, a food-policy expert at Northeastern University, told me.

(10) Nothing else in our daily diet is quite like caffeine. Certainly people **swear by** it, and its benefits are clear: Research shows that it can improve cognitive performance, speed up reaction time, and boost logical reasoning, and it may even reduce the risk of Parkinson's, diabetes, liver disease, and cancer. But for a substance so ubiquitous that it's called the most widely used drug in the world, our grasp of how to maximize its benefits is feeble at best. Even the most seasoned coffee drinkers sometimes unintentionally get too wired; as new, more highly caffeinated products become available, instances of caffeine drinkers overdoing it will probably become more common. Perhaps the best we can do is learn how much of each drink we can handle, one super-charged sip at a time.

Millman, R. 26 Out 2023. 12:50. Tweet. Disponível em <https://twitter.com/rachelmillman/status/1717569286762332444>; Acesso em: 28/03/2024

After reading the article by Yasmin Tayag, it is possible to infer that the meaning of the word 'underrated', in the post above, is:

- a) exaggerated;
- b) necessary;
- c) annoying;
- d) downplayed;
- e) understandable.

"I had to quit drinking coffee. It keeps me awake during presentations."

Disponível em: https://www.glasbergen.com/ngg_tag/quit-drinking-coffee/; Acesso em 28/3/2024

What produces the mockery in the cartoon above is:

- a) the fact that it ironically underestimates the effect of coffee in keeping people awake;
- b) the character's way to say he would rather be asleep during presentations;
- c) the fact that coffee is the character's best friend as he has to drink it in order to attend presentations;
- d) the character's way to say he would rather be awake during presentations;
- e) the fact that the person wearing the dotted tie is trying to convince the other to stop drinking coffee by telling an anecdote.
